WPF

Windows Presentation Foundation

or is it?

Worried?   Puzzled?   Flummoxed?

Don't panic!

Ways WPF is being made accessible for APL developers

- Event handling
    - Xaml `<object Click="{apl:Event FunctionX}"` etc.
    - APL `object #.WPF.Event.Add 'Click' 'FunctionX'`

- Commands
    - Xaml `<object Command="{apl:Command CommandX}"`
    - APL `object #.WPF.SetCommand command [Namspace  [Header]]`

    - Command templates in VS to allow the creation of custom user commands

- Helpful utilities that handle aspects of WPF such as types, objects, et al

- DataBinding
  - Xaml   `<object DataContext="{apl:Binding VarA}"` etc.
  - APL   `bind←object 'DataContext' #.WPF.Binding.Bind 'VarA'`

- Documentation aimed at an APL Developer

- Covers for some of the Dyalog ⎕WC objects; the first being the APL/W Grid

- Xaml compilation

- Syncfusion Controls

So yes an APL developer

can do everything and more than a C# developer

(how could we ever doubt that?)

So think of it as

Wonderfully **P**erfectly **F**easible

(come and see how on Thurs)
