How many dimensions
does a vector have?

Nicolas Delcros

How many dimensions does a vector have?

- Math: N scalars
 - APL: 1 axis
 - Chart: 2 degrees of freedom
 - Geek: real or ~~complex~~?
-
- We're interested in degrees of freedom of a real vector

How many dimensions does a vector have?

- $vec \leftarrow ? 100 p_0$

- Domain: 1d (e.g. time)
- Image: 1d (e.g. acoustic pressure)

Degrees of freedom of a sound

- Domain : time (1d) + frequency (1d)
- Image : magnitude (1d)
- Notion of frequency

Time-wise representation of a sound

Crash course: Fourier transform (FT)

Crash course: Fourier transform (FT)

- $\text{output}[i] \leftarrow \text{atoms}[i;] + .\times \text{input}$
- $\text{output} \leftarrow \text{atoms} + .\times \text{input}$
- The FT is non-local (sines are non-zero)
- The concept of frequency requires complex scalars (sines have magnitude and phase)
- Atom matrix wraps in both directions

Frequency-wise representation of a sound

Frequency-wise representation of a sound

Frequency-wise representation of a sound

- Domain: time (1d)
 - Image : amplitude (1d)
 - Domain: frequency (1d)
 - Image : magnitude (1d) + phase (1d)
- NB. number unique samples: $\lceil 1 + 0.5 \times \omega \rceil$

Degrees of freedom of a sound

- Domain : time (1d) + frequency (1d)
- Image : magnitude (1d)
- Domain: frequency (1d)
- Image : magnitude (1d) + phase (1d)
- Notion of time-limited frequency

Crash course: short-time FT (frames)

The time-frequency plane

The time-frequency plane

The time-frequency plane

The time-frequency plane

- Domain : time (1d) + frequency (1d)
- Image : magnitude (1d)
- Domain: time (1d) + frequency (1d)
- Image : magnitude (1d) + phase (1d)
- Happy end?

The ~~uncertainty~~ dispersion principle

- Dispersion(time) \times Dispersion(frequency) \geq constant
- Continuous FT: standard deviation (Heisenberg)
- Discrete FT: number of non-zero values (support)
- A signal cannot be time-limited and frequency-limited
- Information is non-local in at least one domain
- Time-frequency information is frame-dependent (subjective)

The ~~uncertainty~~ dispersion principle

How many dimensions does a vector have?

- Domain: time (1d)
- Image: amplitude (1d)

How many dimensions does a vector have?

- Domain : time (0.5d?) + frequency (0.5d?)
- Image : magnitude (1d) + phase (1d)
- Dual domain is introduced and restricted by a choice
- There are more (invertible?) choices than signals

What's a dimension anyway?

Nicolas Delcros

Nic's question

- \mathbb{Q} : $(a/b) + (c/d) = (ad+bc) / (bd)$
- \mathbb{C} : $(a+ib) \times (c+id) = (ac-bd) + i(ad+bc)$
- Why should scalars be 2d?
- Can the brain cope with complex not being 2d?
